

1. They all are coming from the MainActivity class; they do indicate an existing application state.
2. onPause, onStop, key:android:viewHierarchyState, onStart, onResume.
3. The onCreate notifications are only displaying as onCreate NO state. Even when killing the app, this could be due to the fact I'm not explicitly saving anything.
4. My activity was not recreated, I know this because onCreate was not called, but instead onStart was called followed by onResume.
5. That my activity was recreated, onCreate No state was called, and the name field is empty.
6. The first push takes us back to the website, the second back to my original activity, the name field is filled in with the name I had entered, and then the final push exits the app. This all makes sense because the app was never killed, and it just recreated a new instance of my activity.
7. This makes sense since the activity that is opened from sharing it with our app, is launched using the browser app. Similar to when we launch the site from our app, and hit the home button, it doesn't show the browser as a recent app. It shows ours, with our app name, logo and the preview is of the browser.
